UX Testing Results

Demographic Questions:

- How old are you?
    - 19, 20, 21, 22, 24

There wasn't much variety in the ages of the testing group, so results from testing now wouldn't accurately reflect the experience someone older or younger might have playing.

- What is your preferred game genre?
    - no preference
    - RPGs
    - MMORPG, cozy games, action games
    - RPGs
    - FPS/TPS, platformers, RPG

Overall, the testing group preferred RPGs as the genre of choice, with some extras tossed in. The tester preferring FPS and the MMORPG tester are the outliers, given the decent overlap with platformers and action.

Likert Scale:

- The UI was easy to understand from a glance
    - 2 Neutral, 2 Agree, 1 Strongly Agree

The UI being easy to understand is very important for my style of game, since most of the game's information will be coming from the UI itself. Getting the feedback from players, especially players that aren't overly familiar with the genre, that it's easy to understand at a glance means that it's fulfilling its purpose well

- Controlling the character felt smooth and responsive
    - 1 Neutral, 3 Agree, 1 Strongly Agree

Overall, players found the character easy to move and responsive. Having this feedback lets me know that the movement isn't too sensitive and doesn't run the risk of making someone potentially sick due to the camera spinning too quickly around.

- Visual indication helped me understand what to do
    - 1 Neutral, 2 Agree, 2 Strongly Agree

The swing of one Neutral being swayed shows the difference between this and the first question - meaning that even if they found the UI more confusing, visual indicators were a help to them

as they played. This shows that if someone jumps in and gets lost, having good visual indicators of what to do will help them figure out how things work.

Open ended question:

Even with the question being pointed specifically to visual indicators, lots of different feedback was provided. One tester recommended adding better indication when an order is failed and resets. Another recommendation was a reticle that would appear when hovering over something interactable, like a chat bubble for customers and a hand for machines. Another tester also recommended better feedback for the add-ins menu for making drinks. The answer variety was really helpful, especially since all of the suggestions are QOL that I now know are definitely worth implementing from their experiences.

In game data:

Most testers didn't complete many orders, typically because of various bugs that caused breaks in the customer loops that caused errors in the ordering. The data returned from one tester also showcased a big bug in the completion counting logic - with every other tester having single digit complete orders, they submitted 19,450 orders. If I hadn't had save data submitted, the error would have taken longer to catch and fix, given that it can only be triggered in certain situations by certain customers.
